Table 3. Source and Query Identifiers 9

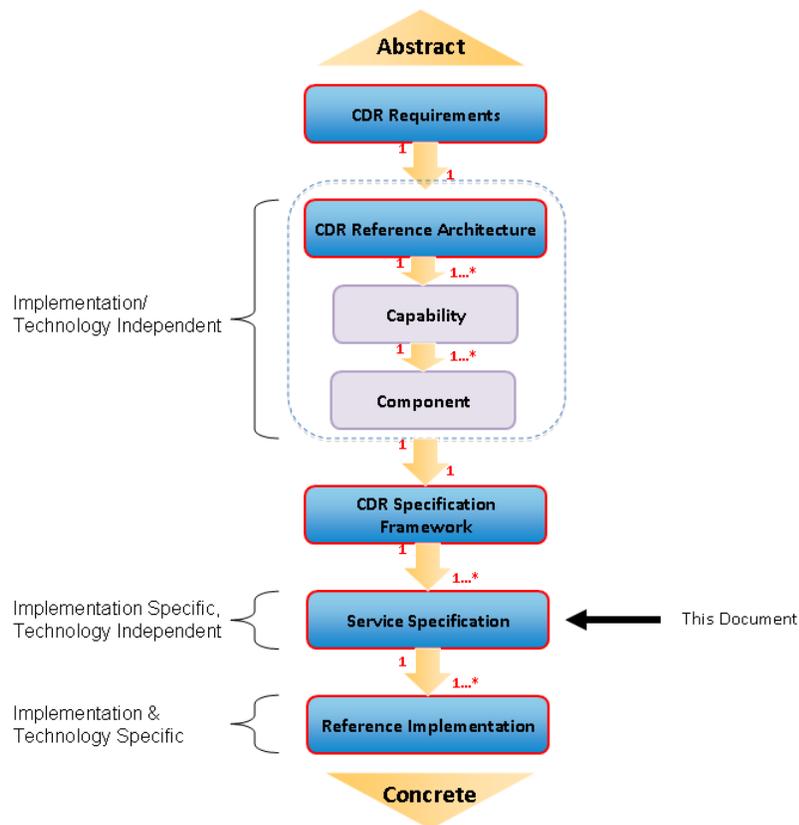

1 Introduction

2 1.1 Service Overview

3 An OpenSearch search service may serve as a federated search broker to multiple
4 sources. This specification defines an OpenSearch extension with parameters and
5 response elements that support this functionality.

6 1.2 Relationship to Other CDR Architecture Elements

7 The CDR Architecture prescribes an abstract-to-concrete model for the development of
8 architecture elements and guidance for content discovery and retrieval. Each layer or tier
9 of the model is intended to provide key aspects of the overall guidance to achieve the
10 goals and objectives for joint DoD/IC content discovery and retrieval. The following
11 graphic, discussed in detail within the CDR Reference Architecture [CDR-RA],
12 illustrates this model.
13

14
15 **Figure 1 - CDR Architecture Model**

16
17 As illustrated in Figure 1, the Specification Framework derives from the Reference
18 Architecture (RA) and can describe behavior in terms of the capabilities, components,
19 and usage patterns defined in the RA. The Specification Framework allows multiple

20 Service Specifications to provide consistent interfaces, both in terms of the structure and
21 semantics of the exchanged information.

22
23 This specification provides guidance for implementing the CDR Brokered Search
24 Component using the RESTful OpenSearch [OS] standard. It is intended to provide
25 minimal requirements for implementing an OpenSearch search broker. Additional sub-
26 specifications will provide further guidance for implementation profiles that include
27 specific query types and result formats.

29 **1.3 Notational Convention**

30 The key words "MUST," "MUST NOT," "REQUIRED," "SHALL," "SHALL NOT,"
31 "SHOULD," "SHOULD NOT," "RECOMMENDED," "MAY," and "OPTIONAL" in
32 this specification are to be interpreted as described in the IETF RFC 2119. When these
33 words are not capitalized, they are meant in their natural-language sense.

34
35 When describing concrete XML schemas and example XML documents, this
36 specification uses XPath as the notational convention. Each member of an XML schema
37 is described using an XPath notation (e.g., /x:RootElement/x:ChildElement/@Attribute).

38
39 Examples in this text are distinguished by a black border. These are meant to be
40 illustrative and only one way that the described syntax can be used.

41
42

```
<atom:entry>  
43 <atom:title>This is an example.</atom:title>  
44 </atom:entry>
```

46 **1.4 Conformance**

47 Conforming brokered search services MUST support all of the required parameters and
48 elements herein.

49 **1.5 Namespaces**

50 Namespaces referenced in this document and the prefixes used to represent them are
51 listed in the following table.

52

53 **Table 1 – Referenced XML Namespaces**

Prefix	URI	Description
opensearch	http://a9.com/-/spec/opensearch/1.1/	OpenSearch 1.1 (Draft 4) ¹
atom	http://www.w3.org/2005/Atom	Atom 1.0
fs	http://a9.com/-	OpenSearch Federation

¹ The OpenSearch specification can be found at http://www.opensearch.org/Specifications/OpenSearch/1.1/Draft_4.

/opensearch/extensions/federation/1.0/

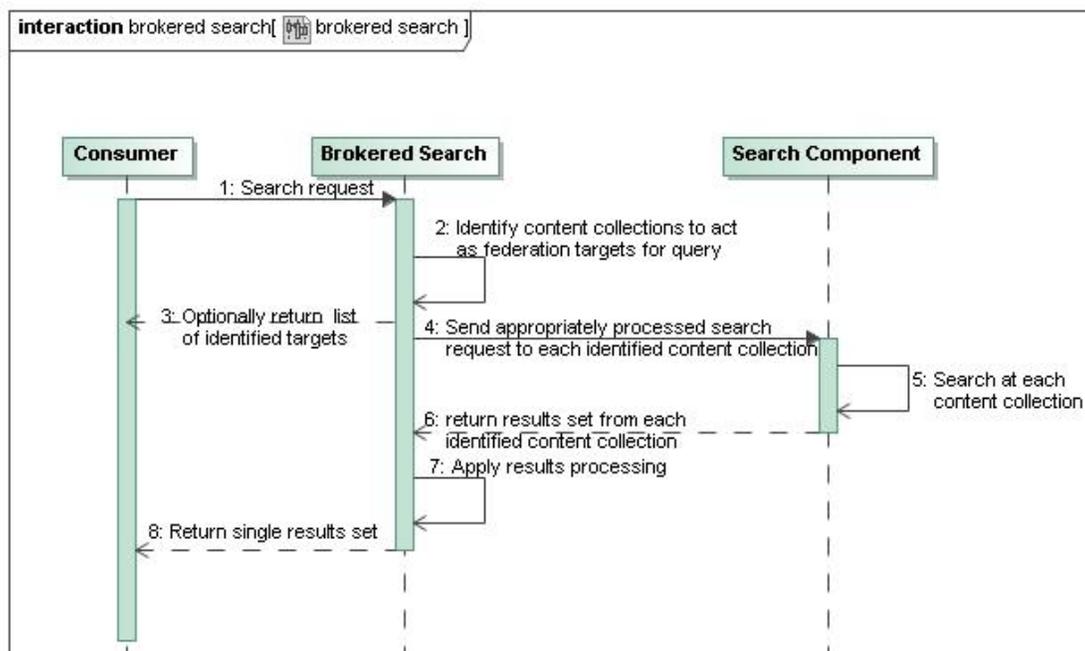

Extension (proposed)

54 **1.6 License**

55 This specification is licensed under the Creative Commons Attribution-ShareAlike 2.5
56 Generic License (<http://creativecommons.org/licenses/by-sa/2.5/>), because it builds on
57 the OpenSearch [OS] standard, which is licensed with the share-alike clause.

58 **2 Search Service Behavior**59 **2.1 Main Flow**

60

61

62

63

64

65

66

67

68

69

70

71

72

73

74

75

76

77

78

1. The Consumer invokes the Brokered Search function.
2. The Brokered Search Component identifies the Search Components that will act as the federation targets.
3. The Brokered Search Component may pass a list of identified federation targets to the Consumer.
4. The Brokered Search Component passes the search request to each Search Component identified as a federation target.
5. Search is executed as appropriate at each federation target, generating a results set.
6. Each invoked Search Component returns results set to the Brokered Search Component.
7. The Brokered Search Component carries out the Results Processing activity.
8. The Brokered Search Component returns the processed results to the Consumer, ending the interaction.

79 **2.2 Alternate Flow**80 **2.2.1 Consumer retrieves source list from broker**

81 Prior to step 1, the consumer may request a list of sources from the broker. The broker
82 returns a list of sources with identifiers that the consumer may use to identify the set of
83 sources to which the broker should route a query.

84

85 This specification does not support *ad hoc* routing, in which the consumer requests that a
86 query be routed to a back-end source for which the broker does not have a registered
87 endpoint. The process for registering new search components with the broker is outside
88 the scope of this specification.

89 **2.2.2 Broker returns a query identifier**

90 At any point between steps 2 and 8 inclusive, the broker may return a response to the
91 consumer containing a query identifier. The client may use this identifier in subsequent
92 requests for information about the progress and results of that particular query.

93 **2.3 Specification Framework Inputs/Outputs**

94 Table 2 shows each of the parameters and elements defined in this specification, and
95 maps each of them to one or more brokered search activities, as defined in the IC/DoD
96 Content Discovery and Retrieval Specification Framework [CDR-SF] . Items shown in
97 brackets (“[]”) refer to inputs and outputs defined and described in the CDR-SF (see
98 Table 9 in the CDR-SF).

99

100

Table 2. Specification Framework Activities, Inputs, and Outputs

Brokered Search Activity	Inputs	Outputs
Brokered Search Coordination	queryId, [Search Component Inputs]	[Brokered Search Status], [Search Outputs], SourceDescription, shortName, longName, description, link
Source Identification	routeTo	resultSource
Search Component Invocation	maxResults maxTimeout	queryId, sourceStatus, shortName, status, resultsRetrieved, totalResults, elapsedTime
Federation Results Processing	queryId, sourceFilter includeStatus	queryId

101

102 The interactions between a brokered search component and its consumer described in this
103 specification use identifiers to track sources (back-end search components) and queries.

104 Table 3 lists the names of the identifiers for two key tasks, identifying sources and
105 keeping query state, divided into the three locations where they may be used: the
106 OpenSearch Description Document (OSDD), the request parameter, and the response
107 element.

108
109 A federated search broker MAY provide stateful interaction in order to improve
110 responsiveness and avoid redundant requests to the back-end sources. The queryId,
111 sourceFilter, and includeStatus parameters allow stateful interaction with the broker for a
112 particular search request.

113

114

Table 3. Source and Query Identifiers

Identifier Location	Source Identification	Query State
OSDD Element	sourceDescription/@sourceId	N/A
Request Parameter	routeTo, sourceFilter	queryId
Response Elements	resultSource/@sourceId, sourceStatus/@sourceId	queryId

115

116 **3 Search Service Interface**

117 **3.1 Request Parameters**

118 This extension adds the following request parameters:

- 119 • Stateless Initial Request Parameters
 - 120 ○ routeTo
 - 121 ○ maxResults
 - 122 ○ maxTimeout
- 123 • Stateful Subsequent Request Parameters
 - 124 ○ queryId
 - 125 ○ sourceFilter
 - 126 ○ includeStatus

127 **3.1.1 The “routeTo” parameter**

128 An-comma-separated list of source identifiers, to which the search query should be
129 routed. The source identifier is found via the “sourceId” attribute in the OpenSearch
130 Description Document (OSDD), described in section 3.2. The same identifier is also
131 referenced by the sourceId attribute in response elements described in section 3.3.

132

133 A broker MAY treat the routeTo parameter as optional, by indicating so in the URL
134 templates in its OSDD. That is, if the routeTo parameter is missing, the broker will route
135 the query to a default set of sources or route to a set of sources based on attributes of the
136 query.

137

138 There is no significance to the order in which the sources are listed (i.e., it should not be
139 assumed that the sources will be queried in the order they are listed in this parameter).

140 The source identifiers MUST be URL encoded and MUST NOT contain commas.

141

142 If a source in the routeTo list is not recognized by the broker, it MUST return an
143 Unknown Source Fault.

144

145 Example URL template:

```
146 http://example.com/?q={searchTerms}&src={fs:routeTo?}
```

147

148 Example request:

```
149 http://example.com/?q=test&src=abc,xyz
```

150

151 3.1.2 The “maxResults” parameter

152 The maximum number of results the federated search broker SHOULD retrieve and
153 process, across all sources. The purpose of this parameter is to improve response times
154 and reduce the amount of storage required of the broker for stateful interactions. The
155 broker MAY determine how to allocate the maxResults number across its back-end
156 sources. For example, it may request the same number of results from each source, or it
157 may vary the number of results requested from the sources. Not all search sources allow a
158 consumer to dictate the maximum number of results, so this parameter may simply serve
159 as a suggestion indicating the consumer’s desired maximum number of results.

160

161 A broker MAY treat the maxResults parameter as optional, by indicating so in the URL
162 templates in its OSDD.

163

164 Example URL template:

```
165 http://example.com/?q={searchTerms}&src={fs:routeTo?}&mr={fs:maxResults}
```

166

167 Example request:

```
168 http://example.com/?q=test&src=abc,xyz&mr=100
```

169

170 3.1.3 The “maxTimeout” parameter

171 The maximum number of milliseconds the federated search broker should wait for
172 sources to respond. The maxTimeout parameter MAY be passed along to back-end
173 sources that accept a timeout parameter, but it is primarily intended to indicate to the
174 broker how long the consumer is willing to wait for slow-to-respond sources. When
175 passing a maxTimeout value to a back-end source, the broker MAY modify the value to
176 ensure adequate performance.

177

178 A broker MAY treat the maxTimeout parameter as optional, by indicating so in the URL
179 templates in its OSDD.

180

181 Example URL template:

```
182 http://example.com/?q={searchTerms}&src={fs:routeTo?}&mt={fs:maxTimeout?}
```

183

184 Example request:

185 `http://example.com/?q=test&src=abc,xyz&mt=3000`

186

187 **3.1.4 The “queryId” parameter**

188 The queryId parameter indicates to the broker which previous request the current request
189 relates to, and it MUST match the string value provided by the broker in response to the
190 initial request in the queryId response element. (See Table 3. Source and Query
191 Identifiers for the names and locations of query identifiers.)

192

193 The following example shows the queryId parameter being used to request the second
194 page of results. Parameters that support paging, including the startPage parameter, are
195 defined in the OpenSearch specification [OS].

196

197 A broker MAY treat the queryId parameter as optional, by indicating so in the URL
198 templates in its OSDD.

199

200 Example of initial request and follow-up request for the second page of results:

201

202 Example URL templates:

203 `http://example.com/?q={ searchTerms }`

204 `http://example.com/?id={ fs:queryId }&start={ startPage? }`

205

206 Response includes:

207 `<fs:queryId>1234</fs:queryId>`

208

209 Example request:

210 `http://example.com/?id=1234&start=2`

211

212 **3.1.5 The “sourceFilter” parameter**

213 The sourceFilter parameter allows the consumer to view results from one particular
214 source. It MUST be used with a queryId parameter, and its value MUST be the URL
215 encoded identifier for one source. A consumer may make multiple requests, each time
216 with a different sourceFilter parameter, to get results for multiple sources.

217

218 A broker MAY treat the sourceFilter parameter as optional, by indicating so in the URL
219 templates in its OSDD.

220

221 Example URL template:

222 `http://example.com/?id={ fs:queryId }&filter={ fs:sourceFilter }`

223

224 Example request:

225 `http://example.com/?id=1234&filter=abc`

226

227 **3.1.6 The “includeStatus” parameter**

228 The includeStatus parameter indicates to the broker whether or not the consumer wishes
229 to receive status information on the backend sources with the results. A broker MAY
230 treat the includeStatus parameter as optional, by indicating so in the URL templates in its
231 OSDD. A broker MAY include status information by default and MAY indicate support
232 to requests that contain the queryId for a previous request. A value of “1” indicates that
233 status information should be included in the response (see The “sourceStatus” element).
234 A value of “0” or “” causes sourceStatus not to be included.

235

236 Example URL template:

```
237 http://example.com/?id={fs:queryId}&status={fs:includeStatus?}
```

238

239 Example request:

```
240 http://example.com/?id=1234&status=1
```

241

242 Example of initial request and follow-up request for status:

```
243 http://example.com/?q=test
```

244

245 Response includes:

```
246 <fs:queryId>1234</fs:queryId>
```

247

248 Subsequent requests for status on the query:

```
249 http://example.com/?id=1234&status=1
```

250 **3.2 OpenSearch Description Document Elements**

251 The Web interface for an OpenSearch service is described in an OpenSearch Description
252 document (OSDD). An OpenSearch Brokered Search service may include a list of back-
253 end sources in its OSDD, using the “sourceDescription” element.

254

255 Example source XML:

```
256 <fs:sourceDescription fs:sourceId="abc">  
257     <fs:shortName>My Source</fs:shortName>  
258     <fs:longName>My Example Source</fs:longName>  
259     <fs:description>An OpenSearch service for foo data.</fs:description>  
260     <fs:link rel="self" type="text/xml" href="http://example.com/description.xml" />  
261 </fs:sourceDescription>
```

262

263 **3.2.1 The “sourceDescription” element**

264 REQUIRED. This element contains sub-elements describing one back-end source. It
265 contains a REQUIRED attribute, “sourceId”. The sourceId attribute value is used to build
266 the list of sources in the “routeTo” request parameter.

267 3.2.2 The “shortName” element

268 REQUIRED. Contains a human-readable name identifying the source. MUST be
269 composed of 16 or fewer characters of plain text and MUST NOT contain
270 markup.

271 3.2.3 The “longName” element

272 OPTIONAL. Contains a human-readable, extended name identifying the source.
273 MUST be composed of 48 or fewer characters of plain text and MUST NOT
274 contain markup.

275 3.2.4 The “description” element

276 OPTIONAL. Contains a human-readable description of the source. MUST be
277 composed of 1024 or fewer characters of plain text and MUST NOT contain
278 markup.

279 3.2.5 The “link” element

280 OPTIONAL. Provides access to resources that offer additional information or
281 functionality related to the source. Contains the following attributes:

- 282 • href – REQUIRED. Contains a URL for the linked resource.
- 283 • rel – REQUIRED. Contains a string representing the relationship of the linked
284 resource. Value may be one of:
 - 285 ○ “self” – The linked resource provides additional information about the
286 source and the content collection(s) it exposes.
- 287 • type – REQUIRED. Contains a IANA content type for the linked resource.

289 3.3 Response Elements

290 This extension defines three primary response elements, resultSource, queryId, and
291 sourceStatus. The sourceStatus element has a number of child elements associated with it.

292 3.3.1 The “resultSource” element

293 REQUIRED. The resultSource element MUST be included with each item returned in the
294 search results, and indicates which back-end source(s) returned it. If de-duplication is
295 applied during processing, multiple sources MAY be associated with the same result.

296
297 The resultSource element MUST contain a “sourceId” attribute and the contents of the
298 element MUST be the human-readable short name for the source (see section 3.2.2).

299
300

301 Atom result example:

```
302 <entry xmlns:fs="http://a9.com/-/opensearch/extensions/federation/1.0/">
303   <title>This is an Example Page</title>
304   <link href="http://example.com/foo/index.html" type="alternate"/>
305   <fs:resultSource fs:sourceId="abc">My Source</fs:resultSource>
306   <id>http://example.com/foo/index.html</id>
307   <date-created>2010-05-05</date-created>
```

```

308 <summary>... As the US Army transitions to a force for the 21st Century, so does the
309 Army&#39;s only independent operational test organization - the US Army
310 Operational Test ... </summary>
311 </entry>

```

3.3.2 The “queryId” element

OPTIONAL. A broker MAY include a queryId element in its response to indicate that it supports interaction with the cached query result set.

- The queryId element MUST contain a string that identifies a result set cached by the broker.
- The consumer MAY pass the string as the value of the queryId parameter in subsequent requests.
- If the result set referenced by a queryId has been removed from the cache, the broker must return a QueryIdExpired exception.

321

322 Atom result example:

```

323 <feed
324   xmlns="http://www.w3.org/2005/Atom"
325   os="http://a9.com/-/spec/opensearch/1.1/ "
326   xmlns:fs="http://a9.com/-/opensearch/extensions/federation/1.0/ " >
327
328   <title>Search results for “example”</title>
329   <fs:queryId></fs:queryId>
330   ...
331   <entry>...</entry>
332   <entry>...</entry>
333   ...
334 </feed>

```

3.3.3 The “sourceStatus” element

OPTIONAL. A broker MAY include a sourceStatus element to give the consumer diagnostic information on the overall progress of a search request, and information on each source that was included in the request. If the broker supports the includeStatus parameter (see section 3.1.6), then sourceStatus elements MUST be provided in the response if the consumer requests them by setting fs:includeStatus=1 in the request. When included, there MUST be one sourceStatus element for each source requested. The sourceStatus element MAY be extended with elements from another XML namespace to provide additional information that the broker implementation can provide.

344

345 The sourceStatus element MUST contain a “sourceId” attribute.

346

347 Example sourceStatus XML:

```

348 <fs:sourceStatus fs:sourceId="abc">
349   <fs:shortName>My Source</fs:shortName>
350   <fs:status>waiting</fs:status>
351   <fs:resultsRetrieved>100</fs:resultsRetrieved>

```

```

352     <fs:totalResults>222222</fs:totalResults>
353     <fs:elapsedTime>2000</fs:elapsedTime>
354 </fs:sourceStatus>

```

355 3.3.4 The “shortName” element

356 REQUIRED. This element provides the human-readable short name of the back-end
357 source, consistent with the “shortName” child element of the “sourceDescription” element
358 found in the OSDD (see section 3.2.2). The shortName value MAY be the same as the
359 sourceId value. The shortName SHOULD be unique for each source belonging to a
360 particular broker.

361 3.3.5 The “status” element

362 REQUIRED. This element reports the current status of a single source. It MUST contain
363 one of the following values:

- 364 • excluded – The source was excluded by the broker. There may be a number of
365 reasons for excluding a source, for example, if a maximum number of sources is
366 exceeded, or if the source doesn’t support query parameters in the request.
- 367 • waiting – The search request has been sent to the source, and the broker is waiting
368 for a complete response from the source.
- 369 • error – The source returned an error response.
- 370 • timeout – The source failed to respond within the configured timeout period.
- 371 • processing – The broker received a complete response from the source, but is
372 processing the result set (e.g., converting format, merging with other results, re-
373 ranking).
- 374 • complete – A response was successfully received and the result set from this
375 source has been processed.

376 3.3.6 The “resultsRetrieved” element

377 OPTIONAL. This element reports the number of search results that the broker retrieved
378 from the source.

379 3.3.7 The “totalResults” element

380 OPTIONAL. This element reports the number of total results matching the query, as
381 reported by the source.

382 3.3.8 The “elapsedTime” element

383 OPTIONAL. This element reports the elapsed time, in milliseconds, for the source
384 response.

385

386 3.4 Fault Conditions

387

Fault	HTTP Status	HTTP Status Description
-------	-------------	-------------------------

Query Type Not Supported	400	Bad Request
Invalid Query Syntax	400	Bad Request
Query Term Not Supported	400	Bad Request
Query Timeout	500	Server Error
Query Execution Fault	500	Server Error
Query Metadata Fault	400	Bad Request
Security Fault	403	Forbidden
Invalid Paging Value Fault	400	Bad Request
Out Of Range Fault	404	Not Found
Result Sorting Not Supported	400	Bad Request
Result Format Not Supported	406	Not Acceptable
Brokered Search Properties Fault	400	Bad Request
Invocation Results Set Fault	200	OK – Indicate error using sourceStatus element
Invocation Results Optional Output Fault	200	OK – Indicate error using sourceStatus element
Merge Fault	500	Server Error
Unknown Source Fault	400	Bad Request

388

389

390 **4 Search Service Implementation**

391 This section provides additional implementation guidance beyond the behavior and
392 interface guidance provided in the previous sections.

393 **4.1 Policy**

394 This specification defines the technical requirements and guidelines for implementing a
395 Brokered Search service. Policy for Brokered Search service implementations is
396 described in auxiliary documents. See the Reference Documents section for a listing of
397 relevant policy documents. Implementers **MUST** follow the guidance in those policy
398 documents.

399 **4.2 Query Extension Handling**

400 An OpenSearch federated search broker **MAY** select federation targets based on the
401 query type submitted by the consumer and the supported query types at each back-end
402 source. The query type for a request **SHOULD** be identified by the presence of
403 OpenSearch extension parameters, such as those belonging to the Geo [OS-GEO] and
404 Time [OS-TIME] extensions, and **MAY** also be identified by inspecting the contents of
405 the OpenSearch “searchTerms” parameter (e.g., to detect the presence of Boolean
406 operators, AND, OR, NOT, or to detect fielded search terms, such as site:<term>,
407 intitle:<term>, etc.).

408

409 A broker **SHOULD NOT** forward a query to back-end sources that do not support its
410 query type.

411

412 **4.3 Result Types**

413 The CDR Specification set includes a single predefined Result Type definition that
414 IC/DoD organizations can leverage in their Search service implementations, the IC/DoD
415 Content Discovery and Retrieval Atom 1.0 Result Set Specification [CDR-ATOM].
416 Implementers **SHOULD** consult appropriate policy and implementation guidance to
417 determine requirements or recommendations concerning the use of particular Result
418 Types.

419 **4.4 Security Considerations**

420
421 Any resource may have associated policies for use, especially as applies to authentication
422 and authorization. These policies may be asserted by both the resource owner and those
423 responsible for governance and management of the enterprise. The implementation of
424 policies related to security considerations **SHOULD** leverage the specific security
425 components and interactions defined by the Joint IC/DoD Security Reference
426 Architecture (SRA), and **MUST** be in compliance with requirements and guidance for
427 security outcomes as specified in the SRA and its associated specifications.
428

429 Implementers using the queryId parameter and element for stateful interactions **MUST**
430 prevent a requester from using a queryId to access a result set for which he/she is not
431 authorized (e.g., guessing a queryId to gain access to results from a previous requester).
432

433 **5 Reference Documents**

434 The documents in this section provide the foundation for the Search service. Each
435 document is assigned a reference identifier, which is cited when the document is
436 referenced within this Search Service Specification.
